Release Notes of Continuous Delivery

November 14, 2024

🚀 Version 1.20.8 includes highest priority bugs and continuous delivery (CD) tasks

Here are the key implementations and fixes:

1. Analytics dropdown in top navigation was not visible to 'user' role even when "All community members" or "user" roles were selected.
2. Assign by profile was not persisting.
3. Workflow stage assignment - Assign by custom field was not persisting.
4. Additions made to star ratings functionality to improve user experience.
5. Scorecards completed "count" were not working on the frontend in the default analytics views.
6. Challenge settings - Retroactive updates for existing ideas within a challenge for milestones and tasks.
7. The integration page wasn't loading consistently when the user selected a specific integration.
8. Additional brief was not getting pulled over on challenge cloning.
9. Fixed spacing issues with longer status titles.

Detailed Notes For Each Task:

1. Analytics dropdown in top navigation was not visible to 'user' role even when "All community members" or "user" roles were selected.

    ● This issue prevented certain user roles from accessing the Analytics section, limiting their ability to view critical data and perform necessary tasks associated with analytics.

    ● Updated the role-based visibility permissions for the Analytics dropdown in the top navigation to ensure that users with "All Community Members" or "User" roles can now view and access it as expected.

- Tested and verified ✅

2. Assign by profile was not persisting.

- The "Assign by Profile" feature was not persisting correctly after initial assignment, causing selected users or profiles to lose their assigned tasks upon refresh or navigation.
- This issue led to interruptions in workflow and task tracking, as assignments made using the "Assign by Profile" option were not saved reliably, affecting team collaboration and task accountability.
- Corrected the persistence logic for the "Assign by Profile" feature to ensure assignments are retained accurately across sessions and page loads. Now, user or profile assignments remain saved as expected without manual re-assignment.
- Tested and verified ✅

3. Workflow stage assignment - Assign by custom field was not persisting.

- The "Assign by Custom Field" feature for workflow stage assignments was not persisting correctly, resulting in inconsistent assignee configurations when admins updated stage settings. Updates made by the admin in the workflow assignment settings were sometimes not applied accurately, impacting task tracking and assignment clarity.
- The lack of persistence in assignments affected workflow management, as changes in assignment settings for workflow stages did not consistently reflect across all ideas in the stage, leading to potential confusion and mismanagement of task responsibilities.
- Improved persistence for "Assign by Custom Field" functionality, ensuring that assignment updates are only applied as specified by the admin. Specifically:
  - ➢ **Assignment Persistence Rules**:
    - ■ If an admin updates the "assignment settings" section for a workflow stage (e.g., changing the default assignee), all ideas in that stage will be reassigned according to the new settings.
    - ■ If an admin only updates non-assignment fields (e.g., title or description) without changing assignment settings, no reassignments will occur, preserving any manual assignments.
  - ➢ **Additional Confirmation Modal**:
    - ■ Implemented a confirmation modal that appears when the admin clicks "Save Changes," allowing the admin to choose whether to skip reassignment of ideas that were manually reassigned. Options include:
      - **Yes** - Skip reassigning ideas that were manually reassigned.

- **No** - Reassign all ideas currently in the workflow stage according to the new assignment settings.
  - Tested and verified ✅

4. Additions made to star ratings functionality to improve user experience.

   - User can now sort ideas on community and challenge levels by "highest rating" sorting filter
   - Newly added columns are added from which user can have the average and number of ratings against ideas
   - Tested and verified ✅

5. Scorecards completed "count" were not working on the frontend in the default analytics views.

   - User can now seamlessly view the scorecards completed count in analytics on challenge and community levels
   - Count readily gets updated
   - Tested and verified ✅

6. Challenge settings - Retroactive updates for existing ideas within a challenge for milestones and tasks.
   - Idea that has individual settings of milestones & tasks and admin changes just submission form settings from challenge settings, individual settings will remain intact from now on
   - Admin changes the milestones settings then changes will be applied on individual settings
   - Tested and verified ✅

7. The integration page wasn't loading consistently when the user selected a specific integration.

   - Integrations page gets loaded now with seamlessly
   - User can navigate to any integrated app and make changes
   - Tested and verified ✅

8. Additional brief was not getting pulled over on challenge cloning.

   - No if the user clones the challenge for which the additional brief was enabled, it gets populated on the cloned challenge as well

- Tested and verified ✅

9. Fixed spacing issues with longer status titles. l

- The title with usual character length doesn't affect the bar and count of that status
- Long title more than usual length appear without affecting count of submissions and appear in 3 dots if minimum length exceeds
- Tested and verified ✅
